

Breathe new life into your home

Did you know the air quality in your home may be up to 70 times worse than outside air? Poor indoor air quality can aggravate allergies and asthma and cause headaches and fatigue for everyone in your home.

The good news is you can significantly improve indoor air quality for you and your family with a LifeBreath® HRV – a Heat Recovery Ventilator that delivers clean, fresh outdoor air to every room in your home.

Fresh Air Quality Starts at the Core

The LifeBreath HRV features a heat recovery ventilator with a patented aluminum core, which efficiently transfers heat from outgoing stale air to incoming fresh air.

A LifeBreath HRV lets you enjoy an energy efficient home without breathing harmful indoor fumes from paint, plastics, carpets, adhesives, and household products – and without lingering pet odours and moisture that causes mold.

Introducing
The Living
Breathing
Home™

Official Supplier

LifeBreath is the official supplier of Heat Recovery Ventilators for the Certified Living Breathing Home program.

Visit www.livingbreathinghome.com for more information on the Certified Living Breathing Home program.

Easy to install

Professional contractors can easily integrate an HRV into a new home or retrofit the HRV into an existing system.

Easy to maintain

Twice a year remove the aluminum core from the unit and rinse clean in just a few minutes. Vacuum dust from within the unit and check outdoor weather hoods for leaves and other debris.

Easy to use

The push-button control panel features 4 operating modes and 5 fan speeds. The built-in dehumidistat automatically reduces indoor humidity levels in the winter by activating the fan.

Replace Stale Indoor Air with Fresh Outdoor Air – 8 Times a Day!

The unique dual-stream airflow keeps outgoing stale air separate from incoming fresh air, and completely rejuvenates the air throughout your entire house up to eight times a day! Plus, LifeBreath's balanced ventilation technology replaces indoor stale air with precisely the same amount of fresh air.

Cool fresh outdoor air is drawn into the LifeBreath HRV

This balanced ventilation is critical to prevent moisture buildup in your home during the heating season, which can lead to expensive rot damage and hazardous mold.

Warm, stale air from your home is drawn into the LifeBreath HRV

The Ins and Outs of a LifeBreath HRV

Cool stale air is expelled outside.

Heat from the indoor air is transferred via the unit's aluminum core to the incoming fresh air stream

Your entire home is filled with warm, clean, fresh air

Save energy without sacrificing comfort

Because of the unique ability of an HRV to transfer the temperature of indoor stale air to the incoming fresh air, you'll realize lower heating costs year round while enjoying all the benefits superior indoor air quality delivers. In fact, the efficiency of the LifeBreath HRV is so great that virtually none of the warmth collected from your home is lost to the outside. In summer, the HRV works in reverse - removing heat from the incoming air and transferring it to the outgoing air, keeping your home cool and fresh.

Little Things Mean A Lot

Today's energy efficient homes trap stale air indoors, causing poor air quality and potential health problems for you and your family. What can you do? Rejuvenate your home with fresh, clean outdoor air...

Avoid drowsiness and headaches caused by poor indoor air quality.

Expel harmful fumes from building materials and household products.

Eliminate pet dander as well as odours from pets, cooking, and bathrooms.

Move moist air out and prevent mold, mildew and fungus growth.

TFP Air Cleaner with HEPA Filter

The LifeBreath TFP Air Cleaner with HEPA Filter is an excellent way to improve indoor air quality and minimize health implications due to dirty particles in the air, eliminating up to 99.97% of all airborne particles such as pollen and fungus spores, pet dander, dust mite feces, molds and bacteria as small as 0.3 microns in size.

While other indoor air cleaners simply pass the air through a filter - which decreases air flow and performance - the TFP Air Cleaner harnesses the power of Turbulent Flow Precipitation, which uses varying air flow to separate particles from the air stream and then traps them in the narrow internal fabric walls of the filter. The result is maximum airflow and exceptional filter performance.

The compact LifeBreath TFP Air Cleaner is available with or without HEPA filter, in both whole-house and portable models.

A Fresh New Heating and Cooling Concept

The LifeBreath Clean Air Furnace combines an air handler with a built in heat recovery ventilator and provides exceptional health benefits for everyone in your home.

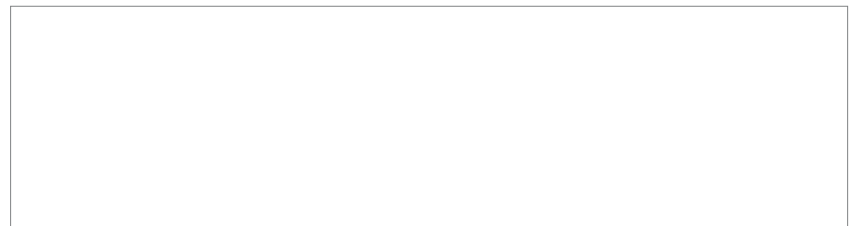

The Clean Air Furnace removes stale indoor air and replaces it with an equal amount of fresh air from the outside. The patented aluminum heat recovery core efficiently transfers the heat from the stale indoor air to the incoming air, resulting in warm, fresh air for every room of your home.

LifeBreath Clean Air Furnaces are available in hydronic or electric models, and feature an optional ECM motor for maximum energy savings.
